

Spicy Avocado

Meeting Notes 12-04-19

Start 3:11pm

- Make separate container for route directions (make its own div)
- Make error messages not overlay on the form
- Populate the to and from forms when starting from saved trips
- Make sure app recognizes the previously saved trips
 - As long as start and end points of trip match, should be the same favorite trip
- Make the location icon pick out the current user location
- Heart was difficult, but we overlayed it on the map
- How to differentiate between trips
 - Start and end
 - Number of stops in between
- How to change the algorithm for multiple stops
 - Just use the order the user provided, and find the trips between each adjacent dock
 - Consider multi-stops as separate trips
- What isn't as important in the design?
 - The fitness/health stats: user would just use our app to get from one point to another. Who cares about fitness
- Modifying Map
 - Adding markers for docks that show extra information
 - Have number of bikes available, number of spots available at each dock
 - How often to update the bike dock information?
 - Whenever the user searches for a trip
 - Maybe we can re-run function that searches for dock info every x seconds: might be a bad idea; API might blow up
- Send Trip emails
 - Problem: emails keep getting to spam folder
 - Solution: use npm package: Node mailer
 - can do html for text body

End 3:32pm
